

GCSE

3400UB0-1

TUESDAY, 13 MAY 2025 – AFTERNOON

BIOLOGY – Unit 2:
Variation, Homeostasis and Micro-organisms

HIGHER TIER

1 hour 45 minutes plus your additional time allowance

Surname _____

First name(s) _____

Centre Number _____

Candidate Number 0 _____

ADDITIONAL MATERIALS

A calculator and a ruler.

ITEMS INCLUDED WITH QUESTION PAPER

A separate Diagram Booklet.

The Diagram Booklet MUST be handed in to the invigilators and sent for marking.

INSTRUCTIONS TO CANDIDATES

Use black ink, black ball-point pen or your usual method.

Write your name, centre number and candidate number in the spaces provided on the front cover.

Answer ALL questions.

Write your answers in the spaces provided in this booklet. If you run out of space, use the additional pages at the back of the booklet, taking care to number the question(s) correctly.

INFORMATION FOR CANDIDATES

The number of marks is given in brackets at the end of each question or part-question.

Question 8(a)(ii) is a quality of extended response (QER) question where your writing skills will be assessed.

(Turn over)

For Examiner's use only		
Question	Maximum Mark	Mark Awarded
1.	10	
2.	10	
3.	5	
4.	7	
5.	6	
6.	6	
7.	8	
8.	7	
9.	9	
10.	12	
Total	80	

Answer ALL questions.

- 1 The ability to taste the chemical phenylthiocarbamide (PTC) is controlled by a single gene called TAS2R38. The allele that allows an individual to taste PTC is dominant to the allele for non-tasting.**

(a)(i) Name the TWO sense organs involved in the detection of chemicals. [1 mark]

1. _____

2. _____

(ii) Explain the meaning of the following terms:

I. gene; [2 marks]

II. allele. [1 mark]

(Turn over)

1 (b) **IMAGE 1.1** in the separate diagram booklet is a family tree showing how the ability to taste PTC has been inherited within a family.

- (i) Complete the Punnett square below to show the possibility of couple **5** and **6** having a child who can taste PTC. Use the key below. [2 marks]

KEY

T = allele for tasting PTC

t = allele for non-tasting PTC

- (ii) **CIRCLE A GENOTYPE** in the **PUNNETT SQUARE** that is **HETEROZYGOUS**. [1 mark]

(Turn over)

1 (b)(iii)

Couple 5 and 6 have another child.

State the probability of this child being able to taste PTC. [1 mark]

Probability = _____

- 1 (c) In 1949, scientists developed a test to identify individuals who were non-tasters for PTC. They used the test to study the percentage of non-tasters in some European countries.**

TABLE 1.2 in the separate diagram booklet shows the result of this test in these countries.

Use TABLE 1.2 to state TWO reasons why the scientists can be confident in the results for PTC tasting. [2 marks]

Reason 1

continue answer on the next page

(Turn over)

Reason 2

10

2 The antibiotic penicillin is produced from **Penicillium** grown in large stainless steel fermenters.

The fermenters contain **Penicillium** in a liquid nutrient culture medium.

(a) Use the five Kingdom system of classification to state the kingdom to which **Penicillium** belongs. [1 mark]

(b) **IMAGE 2.1** in the separate diagram booklet shows a diagram of a fermenter used to produce penicillin.

(i) Aseptic techniques are used when **Penicillium** is added to the fermenter. State the purpose of using aseptic techniques. [1 mark]

2 (b)(ii)

The level of nutrients in the fermenter is controlled.

Use IMAGE 2.1 to state TWO other factors that need to be controlled.

Explain how each factor is controlled.

[4 marks]

Factor 1

Explanation

continue answer on the next page

(Turn over)

Factor 2

Explanation

- (c) **GRAPH 2.2** in the separate diagram booklet shows how the contents of the fermenter changed over a period of six days.
- (i) Use **GRAPH 2.2** to describe how the mass of **Penicillium** changed from **DAY 1 TO DAY 6**.
[2 marks]

(Turn over)

2 (c)(ii)

GRAPH 2.3 in the separate diagram booklet shows the effect of different temperatures on the mass of penicillin produced over time.

Use **GRAPH 2.3** to suggest the optimum temperature and time for penicillin to be extracted from the fermenter. [2 marks]

Temperature _____

Time _____

10

(Turn over)

- 3 (a) European holly trees are an important source of food for wild animals, including rabbits and deer. IMAGE 3.1 in the separate diagram booklet shows leaves collected from the ground under one European holly tree, *Ilex aquifolium*.**

Students investigated variation by studying the relationship between the number of spines on a holly leaf and its height above ground.

- (i) Suggest a hypothesis for this investigation.
[1 mark]**

3 (a) continued

The students used the following method.

1. Select one leaf at random from a holly tree.
2. Record its height above the ground.
3. Record the number of spines.
4. Repeat steps 1 – 3 at different heights on the same tree until the results for 20 leaves have been recorded.

GRAPH 3.2 in the separate diagram booklet shows the results from the investigation.

- (ii) I. Use **GRAPH 3.2** to describe the effect of height on the number of spines on a holly leaf. [1 mark]

3 (a)(ii) continued

- II. Suggest ONE advantage to the tree for the number of spines on leaves found at heights of 1–2 metres. [1 mark]**

- (iii) Give TWO ways in which the strength of the evidence could be improved. [2 marks]**

I.

II.

5

4 **IMAGE 4.1** in the separate diagram booklet shows a section through human skin.

(a) On the answer lines below, write the names of the structures labeled **A**, **B** and **C** in **IMAGE 4.1**. [2 marks]

A _____

B _____

C _____

- 4 (b) In 2022, a reporter from the BBC took part in an experiment at the University of South Wales. The aim was to investigate the effect on the body of living in cold homes.**

The reporter entered a temperature controlled room set at 21°C. The temperature in the room was reduced to 10°C over a 30 minute time period.

IMAGE 4.2 in the separate diagram booklet shows the effect of the temperature change on his body and the time it took him to complete a wordsearch.

- (i) Describe and explain TWO changes in the skin that kept the core body temperature constant during this investigation. [4 marks]**

continue answer on the next page

(Turn over)

4 (b)(ii)

Suggest why the wordsearch took longer at 10°C than at 21°C. [1 mark]

7

5 IMAGE 5.1 in the separate diagram booklet shows part of a DNA molecule.

(a)(i) On IMAGE 5.1, DRAW LINES TO IDENTIFY AND LABEL THE FOLLOWING: [1 mark]

- **Sugar phosphate chain**
- **ONE base molecule**

(ii) State the name used to describe the shape of a DNA molecule. [1 mark]

(b) Sickle cell anaemia is a genetic condition. It is caused by a mutation to the gene that codes for the protein haemoglobin in red blood cells. The mutated gene produces sickle cell haemoglobin that changes the shape of red blood cells.

IMAGES 5.2A and 5.2B in the separate diagram booklet show part of the sequence of bases in the normal and mutated gene. The order of amino acids for which they code is also shown.

(i) DRAW A CIRCLE on the SEQUENCE OF BASES in IMAGE 5.2B to show the mutation. [1 mark]

(Turn over)

5 (b)(ii)

Explain why the mutated gene in IMAGE 5.2B gives rise to sickle cell haemoglobin protein. [3 marks]

[illegible]

continue answer on the next page

(Turn over)

6

- 6** The topshell, **Phorcus lineatus**, is a marine snail that lives along the rocky shores of parts of West Wales.

Students estimated the population density of the topshell on a rocky shore in Wales using the following method.

METHOD

- Use a tape measure to mark out an area of 20 m × 20 m.
- Count the number of topshells and mark their shells with a dab of paint on the underside of the shell.
- Search the same area after 1 day.
- Count the total number of topshells and the number of marked topshells found.

IMAGE 6.1 in the separate diagram booklet shows a topshell.

TABLE 6.2 in the separate diagram booklet shows the results of the survey.

6 (a)(i)

Use the formula below and TABLE 6.2 to estimate the population of topshells in the area sampled. [2 marks]

$$p = \frac{a \times b}{c}$$

where

p = estimated size of population in sample area

a = number of topshells counted in first sample

b = number of topshells counted in second sample

c = number of marked topshells counted in second sample

Population of topshells in the area sampled =

(Turn over)

6 (a)(ii)

Use your answer from part (a)(i) to calculate the population of topshells per m². [2 marks]

Population density =

_____ topshells / m²

(b)(i) State ONE assumption made when using this method to estimate the population density of topshells. [1 mark]

(Turn over)

6 (b)(ii)

Suggest ONE precaution that the students should take during the survey to reduce the risk of harm to topshells. [1 mark]

6

7 IMAGE 7.1 in the separate diagram booklet shows the structure of a human nephron.

(a)(i) Name and describe the process occurring at point X on IMAGE 7.1. [2 marks]

(ii) Explain why you would not expect to find glucose present in the collecting duct. [1 mark]

- 7 (b) School students were provided with three samples (A, B and C) of artificial urine. They tested them for the presence of glucose and protein.**

TABLE 7.2 in the separate diagram booklet shows the results of their tests.

- (i) Describe the chemical tests the students would have used to test for glucose and protein. State the colour that would be observed if the substance was present.**

I. Glucose [2 marks]

II. Protein [1 mark]

7 (b)(ii)

If the samples had come from the urine of hospital patients, use TABLE 7.2 to suggest ONE diagnosis that could be made from the results of:

I. sample B; [1 mark]

II. sample C. [1 mark]

8

8 (a) IMAGE 8 in the separate diagram booklet shows a part of the nervous system involved in a withdrawal reflex.

(i) Apart from being protective, state TWO other properties of a reflex action. [1 mark]

1. _____

2. _____

(ii) Describe the reflex arc shown in IMAGE 8. [6 marks QER]

continue answer on the next page

(Turn over)

[illegible]

7

9 (a)(i)

State ONE type of evidence that scientists use for the classification of living organisms. [1 mark]

(ii) **Apart from classification purposes, state why SCIENTIFIC NAMES are used to identify species. [1 mark]**

- 9 (b) The black ant, ***Lasius niger***, lives in colonies that contain a large number of female worker ants. A small number of male ants are produced when a queen ant is ready to reproduce.

IMAGES 9.1A and 9.1B in the separate diagram booklet show the production of gametes by a queen ant and a male ant. The numbers in each cell show the total number of chromosomes present.

Complete **TABLE 9.2** in the separate diagram booklet to:

State the type of cell division shown in

IMAGE 9.1A and **IMAGE 9.1B**.

State **ONE** piece of evidence for your answer.

[4 marks]

- (c) **IMAGE 9.3** in the separate diagram booklet shows how gametes from the black ant produce male and female ants.

Use **IMAGE 9.3** to explain why the body cells of a male ant contain half the number of chromosomes compared to the body cells of a female ant. [1 mark]

- 9 (d) A species of fungus-eating ant (***Mycocepurus smithii***) is found in Puerto Rico. It has colonies made up entirely of female ants. Most are workers and there is a small number of queen ants.

IMAGE 9.4 in the separate diagram booklet shows how a gamete from ***Mycocepurus smithii*** produces offspring.

State the type of **REPRODUCTION** shown in **IMAGE 9.4**.

Give a reason for your answer. [2 marks]

Type of reproduction

Reason

9

(Turn over)

10 **IMAGE 10.1** in the separate diagram booklet shows a diagram of an influenza (flu) virus.

(a) On the answer lines below, write the names of the structures labeled **A** and **B** in **IMAGE 10.1**. [2 marks]

A _____

B _____

- 10 (b) During the last week of December 2022, there were 3800 patients in England admitted to hospital each day due to flu. This compared with 2000 each day in the previous week.**

People who were feeling unwell were advised to take the following steps to avoid spreading flu or other viruses to more vulnerable people:

- **stay at home**
 - **catch coughs and sneezes in tissues that should then be disposed**
 - **wash hands well**
 - **wear a mask if you go out**
- (i) Calculate the percentage increase in the number of patients in hospital per day due to flu during the last week of December 2022. [2 marks]**

Percentage increase = _____

10 (b)(ii)

Explain why wearing a mask reduces the spread of flu. [1 mark]

- 10 (c) The World Health Organisation (WHO) recommends countries should target high risk groups for flu vaccinations. The WHO target is that 75% of people in all high risk groups should be vaccinated.**

TABLE 10.2 in the separate diagram booklet shows vaccination rates in England in December 2022 for the high risk groups recommended by the WHO.

USE THE DATA in TABLE 10.2 to state TWO conclusions about the success of the vaccination programme in England in December 2022. [3 marks]

10 (d)(i)

Explain why antibiotics are not effective against the flu virus. [1 mark]

(ii) Describe how vaccination protects an individual against flu. [3 marks]

WHAT HAPPENED IN THE COLD CHAMBER?

Air temperature reduced from 21 °C to 10 °C for 30 minutes

- Blood flow to brain fell by 20 %
- Breathing rate increased from 9 breaths per min to 12
- Core body temperature remained the same at 37 °C
- Skin temperature of extremities (legs, arms and head dropped by an average of 2 °C
- Blood pressure increases
- Heart rate up from 55 to 65 beats per min
- Body burned more carbohydrates
